CY United States
LA English
AV INIST-713, 354000073299990200
AB Tensile strength (TS), percent elongation (%E), oxygen permeability (OP), and water vapor permeability (WVP) of ***lactic*** acid and tennet precipitated casein-based edible films were studied to determine the effect of ***protein*** to plasticizer ratio (0.6:1, 1:1, 1.4:1) and plasticizer type (sorbitol, ***glycerol***) on these properties. TS increased (p<0.05) with increase in ***protein*** to plasticizer

ratio. Sorbitol plasticized films were stronger (p<0.05) than
 glycerol plasticized films. However, films plasticized with
 glycerol were more extensible (p<0.05). Film %E decreased with
 increase in ***protein*** /plasticizer ratio for ***lactic*** acid
 casein films, whereas it increased for rennet casein films. Films
 plasticized with sorbitol were more effective (p<0.05) moisture and
 oxygen barriers than ***glycerol*** plasticized films. Overall,
 lactic acid casein films plasticized with sorbitol had the most
 effective mechanical and barrier properties.

Production of ***edible*** ***film*** involves, according to 1 of
 10 examples, the preparation of a 16.6% sodium caseinate solution (pH
 10.0) in completely deionized water, storage to increase viscosity, and
 extrusion onto steel plates coated with polytetrafluoroethylene. After
 treatment in H.sub.2SO.sub.4 and H.sub.2SO.sub.4 + Na.sub.2SO.sub.4 baths
 and washing with deionized water, the film is plasticized in a bath of
 glycerol and formaldehyde, dried with concurrent cross-linking
 removed from the steel plates. Tubular casings may also be produced. The
 caseinate may be partially or fully replaced by ***soy***
 protein, and the water used for washing the plasticized film may
 contain ***citric*** or ***tartaric*** acid.

An improved ***edible*** ***film*** replacing ***glycerol***
 with organic acids naturally present in fruits is disclosed. The
 invention is claimed to reduce the concentration of ***glycerol*** in
 the ***edible*** ***film*** by 75%. It produces a film that
 demonstrates effective inhibition of various pathogens such as Listeria
 monocytogenes, Salmonella Gammaria, and Escherichia coli O157:H7. The
 edible ***film*** also consists of proteins such as soy,
 whey, rice bran extract, egg albumen or wheat ***protein***

or hydrocolloids such as carboxymethyl cellulose, alginate, carrageenan,
 and pectin. The invention utilizes organic acids selected from
 malic, ***lactic***, ***citric*** or ***tartaric***
 acids. It is suitable for coating raw whole or fresh cut fruits and
 vegetables, meat, poultry, seafood, cereals, and nuts.

The ***edible*** film*** is prepd. by dissolving chitosan in a acid, mixing with film-forming or reinforcing agent (polysaccharides or polyols), plasticizing agent (polysaccharides or polyols) and crosslinking agent (anionic polysaccharides, polyacids, or +2 metal cation) to form the film. Thus, chitosan 2 g was dissolved in 100 mL 2% HAc, then mixed with				

poly(vinyl alc.) and ***citric*** acid to form a film with good strength, softness and permeability.

An ***edible*** ***film*** that rapidly disintegrates when placed in the mouth to release an active agent is prepd. The film consists of a ***hydrocolloid*** film-forming material and microparticles contg. active agent. Thus, coating soln. contains starch soln. 53, protein soln. 35, sorbo sorbitol soln. 2.2, polysorbate 80, and encapsulated flavoring agents 9.0 g. Coating soln. is coated onto a polyethylene coated differential release paper using a knife-over-roll coating head. The coated paper is then dried in a drying tunnel and ***hydrocolloid*** matrix is formed.

AB Improved edible films for mucoadhesion are provided. The films include at least three types film forming agents other than pullulan, such as maltodextrins, hydrocolloids and fillers. Preferably, the maltodextrin has a dextrose equiv. of less than 20. Medicaments and other additive agents can also be incorporated into the edible films. In this regard, the edible films can be utilized to deliver or release the medicaments into an oral cavity, such as a pH control agent, an oral care agent, a breath freshening agent, a pharmaceutical agent, a nutritional agent, a salivary stimulant, a vitamin, a mineral, an antimicrobial agent, an anti-plaque agent, an anti-gingivitis agent, and a tartar or caries control agent, thereby providing effective oral treatment with respect to, for example, oral cleansing and breath freshening. For example, a film was prepd. contg. maltodextrin 36.00%, sodium ***alginate***, 22.15%, microcryst. cellulose 20.00%, glycerin 7.30%, flavor 11.00%, lecithin 2.00%, sweetener 1.50%, and color 0.05%.
